

# POULTRY SHIELD Red Mite Eradicator

Supplied by Flyte so Fancy, tel: 01300 345229

## ADVICE and DIRECTIONS FOR USE

- + **Revolutionary approach to controlling Red Mite in Poultry**
- + **Safeguard against Bird Flu**
- + **96% killed in 48 hours including eggs**
- + **Effective against bacteria, virus, yeast and fungi**
- + **Environmentally friendly**
- + **Non-toxic**
- + **Can be used without removing the birds**

Poultry-Shield is a safe liquid concentrate, diluted before use, for spraying onto the Red Mite and their eggs. It is essential that Poultry-Shield actually makes contact with the mite and their eggs. The reaction on contact is the break up of the wax coating causing dehydration and death of the mite. Poultry-Shield at the same time penetrates the protective coating of the mite eggs producing a similar reaction. The kill time from contact of Poultry-Shield with the mite to eventual dehydration is approximately 48 hours.

Poultry-Shield is supplied in 1 litre or 5 litre sizes and diluted at the rate of 1 part concentrate to 10 parts clean water. We recommend regular use of Poultry Shield when cleaning your Henhouse to help prevent infestation of mites and to give the hens a healthy living environment. The effect is the destruction of the mite eggs thus breaking the reproductive cycle. Unlike the powders which only work in contact with the mite, Poultry-Shield has a deep penetrating effect into the cracks, crevices and corners where the mite aggregate to sleep and lay eggs. We also recommend you consider using **Diatom Parasite Control Powder** for it's residual effects when there has been a particularly bad infestation of Mite. This product is 100% natural and works both as a residual powder to keep all mite/lice under control and can also be added to feeds as a wormer, not only with Poultry but also with most pets and animals including Horses.

No egg withdrawal period is necessary after use of these natural products.

More information about Diatom available on the Flyte so Fancy website [www.flytesofancy.co.uk](http://www.flytesofancy.co.uk).

In a 10% solution, this product is able to clean and remove the organic matter present on material, equipments, cages. It has excellent sanitising properties and will reduce cross contamination. Poultry-Shield's deodorising properties will greatly reduce the ammonia content in the atmosphere. Poultry-Shield has also been shown to be effective against maggots, Forage Mite, Litter Mite etc.

Bonuses are that Poultry-Shield is a bactericide, a virucide (kills viruses - particularly important with regard to Avian Flu), and a fungicide. Poultry-Shield is a multipurpose cleaner. Flyte so Fancy recommend

regular cleaning of the Henhouse with this product to keep the danger of all infections at bay. Best applied with a Pressure Sprayer or, on a small scale, with a used, rinsed kitchen cleaner spray bottle.

Dilute at the rate of 1 part of concentrate to 10 parts of CLEAN WATER. If the solution is too strong its benefits will be reduced accordingly. Clean the house in the late afternoon of all litter and debris.  
**Please note:** The house should be dry before the solution is applied. If sprayed when the walls are wet, the Poultry Shield will be diluted again, making it virtually ineffective.

Just before dusk, shut out the hens before thoroughly spraying the house. Having loaded the sprayer, soak the house from top to bottom. Do not rely on just misting the poultry house, as it has to be thoroughly wetted with the solution, so that the liquid can penetrate all cracks and crevices, removing eggs as well as mite. If your house has removable perches, remove these, scrape clean and spray liberally, do the same with their nest boxes/trays. Pay particular attention to where the ends of the perches sit in the house as that is their favourite place (see below).

The birds can be allowed back in immediately. Repeat again within 7 days as a precaution against any missed areas or hotspots. In the case of a bad infestation, should the house have a felted or insulated roof, it may be necessary to strip off the felt, treat and re-felt.

Keep an eye on the crevices for a few days to make sure there are no places where the solution has not reached, especially under the house and re-spray if any are found. The mite will not die immediately but you should notice a difference within 24 hours.
